Notes

The total CFC production in 2003 represented 16% of global CFC production and is falling. From now on emissions of CFC-11 will not be calculated.

Emissions are calculated from production and categorised sales using "emission functions".

The emission function for "Blowing Agents - Closed Cell Foam" was changed from previous compilations in 2001 in view of the results of a survey commissioned by AFEAS:
(Ashford P., 1999, Development of a global emission function for blowing agents used in closed cell foam, Final Report to AFEAS and

McCulloch A., P. Ashford and P.M. Midgley, Historic Emissions of fluorotrichloromethane (CFC-11) based on a market survey, Atmospheric Environment, 35, 4387-4397, 2001)

This showed that, from 1994 onwards, the emission function from closed cell foam was best represented by a constant rate of loss (3.66%/yr) from the accumulated bank in such foams. This results in a step change in the emissions from foams that is unlikely to be real year-by-year but will give a true picture in the longer term.

Within the time-frame of the mid 1990s, the transition from higher to lower emissions is clear from atmospheric measurements and statements about industrial practices.

The assumption of a function to smooth the transition would have been largely subjective and has not been adopted here.

Columns affected by this change are shaded pale green/blue.

The emission function for non-hermetic refrigeration is the same as in previous reports (a 10 year emission time approximately normally distributed about a 4.5 year mean).

The emission function for "Open Cell Foam, Aerosols and others" is the same as in previous reports (50% in the year of manufacture and the rest in the year following, for aerosols and others, and 83% in the year of manufacture for open cell foams).

In previous compilations, fugitive emissions of CFC-11 arising during production were counted and reported in the *Open Cell Foam, Aerosols & Others* category and in *Annual and Total Released*.

However, the reported *Production* did not include this quantity of material. This has now been rectified and, in this compilation, the *Annual* and *Cumulative Production* reported for all years includes the quantities released from the production process. **This does not affect the historical record of releases.**

Table: 2
CFC-12 Production and atmospheric Release

2003																	

Notes

The total CFC production in 2003 represented 16% of global CFC production and is falling. From now on emissions of CFC-12 will not be calculated.

Emissions are calculated from production and categorised sales using "emission functions".

The emission functions for CFC-12 remain the same as in previous AFEAS compilations:

Releases from hermetic refrigeration are normally distributed about an average of 10 years, giving a total service lifetime of 20 years.

The emission function for non-hermetic refrigeration is the same as in previous reports (complete emission in 10 years approximately normally distributed about a 4.5 year mean).

(McCulloch A., P.M. Midgley and P. Ashford, Releases of Refrigerant Gases (CFC-12, HCFC-22 and HFC-134a) to the Atmosphere, *Atmos. Environ.*, 37, 889-902, 2003)

Due to the nature of the plastic foam matrices, half of the material used in closed cell foam is emitted in the year of manufacture and half in the following year.

The emission function for "Open Cell Foam, Aerosols and others" is the same as in previous reports (50% in the year of manufacture and the rest in the year following, for aerosols and others, and 83% in the year of manufacture for open cell foams).

In previous compilations, fugitive emissions of CFC-12 arising during production were counted and reported in the *Open Cell Foam, Aerosols & Others* category and in *Annual and Total Released*.

However, the reported *Production* did not include this quantity of material. This has now been rectified and, in this compilation, the *Annual and Cumulative Production* reported for all years includes the quantities released from the production process. **This does not affect the historical record of releases.**

Table: 3 Production and atmospheric Release
CFC-113 (thousand metric tonnes)

	Expanded Data												Reporting Companies only			(thousand metric tonnes)

Notes

The total CFC production in 2003 represented 16% of global CFC production and is falling. From now on emissions of CFC-113 will not be calculated.

Emissions are calculated from production and categorised sales using "emission functions".

The emission functions for CFC-113 remain the same as in previous AFEAS compilations:

Of the sales into "Short Banking Times" (mainly solvents) and "Other", half are released in the year of manufacture and half in the year following.

Releases from "Long Banking Times" (predominantly heat pumps and similar enclosed systems) are distributed normally about a 10 year mean, with a total service lifetime of 20 years.

In previous compilations, fugitive emissions of CFC-113 arising during production were counted and reported in the *Short Banking Times* category and in *Annual and Total Released*.

However, the reported *Production* did not include this quantity of material. This has now been rectified and, in this compilation, the *Annual* and *Cumulative Production* reported for all years includes the quantities released from the production process. **This does not affect the historical record of releases.**

Table: 4 Production and atmospheric Release
CFC-114 (thousand metric tonnes)

	Expanded Data												Reporting Companies only								
	Annual		Total			Short Banking Times			Long Banking Times			Other			Cumulative			(thousand metric tonnes)

Notes

The total CFC production in 2003 represented 16% of global CFC production and is falling. From now on emissions of CFC-114 will not be calculated.

Emissions are calculated from production and categorised sales using "emission functions".

The emission functions for CFC-114 remain the same as in previous AFEAS compilations:

Of the sales into "Short Banking Times" (mainly aerosols) and "Other", half are released in the year of manufacture and half in the year following.

Releases from "Long Banking Times" (predominantly heat pumps and similar enclosed systems) are distributed normally about a 10 year mean, with a total service lifetime of 20 years.

In previous compilations, fugitive emissions of CFC-114 arising during production were counted and reported in the *Short Banking Times* category and in *Annual and Total Released*.

However, the reported *Production* did not include this quantity of material. This has now been rectified and, in this compilation, the *Annual* and *Cumulative Production* reported for all years includes the quantities released from the production process. **This does not affect the historical record of releases.**

Table: 5 Production and atmospheric Release
CFC-115 (thousand metric tonnes)

	Expanded Data						Reporting Companies only						(thousand metric tonnes)		
	Annual		Total			Short Banking Times			Long Banking Times			Other			
	Production	Released	Production	Released	Unreleased	Sales	Released	Unreleased	Sales	Released	Unreleased	Sales	Released	Unreleased

Notes

The total CFC production in 2003 represented 16% of global CFC production and is falling. From now on emissions of CFC-115 will not be calculated.

Emissions are calculated from production and categorised sales using "emission functions".

The emission functions for CFC-115 remain the same as in previous AFEAS compilations:

Half of the sales into "Short Banking Times" and "Others" are released in the year of manufacture and half in the year following;

Releases from "Long Banking Times" (predominantly refrigeration) are distributed normally about a 4.5 year mean, with a total service lifetime of 10 years.

In previous compilations, fugitive emissions of CFC-115 arising during production were counted and reported in the *Short Banking Times* category and in *Annual and Total Released*.

However, the reported *Production* did not include this quantity of material. This has now been rectified and, in this compilation, the *Annual* and *Cumulative Production* reported for all years includes the quantities released from the production process. **This does not affect the historical record of releases.**

Notes

In previous reports, from 1996 to 2002 fugitive emissions were incorrectly calculated. This has now been rectified with small changes to the data for the years identified.

Emissions are calculated from production and categorised sales using "emission functions".

Of the sales into "Short Banking Times" (mainly open cell foam), 83% are released in the year of manufacture and the remainder in the year following.

Emission functions for releases from "Medium Banking Times" (predominantly refrigeration) are now recognised to have changed in time.

The functions used here are described in McCulloch, Midgley and Lindley, Recent Changes in the Production and Global Atmospheric Emissions of

Chlorodifluoromethane (HCFC-22), submitted to *Atmospheric Environment*, 2005. They comprise:

Up to 1977: Zero use in hermetic systems and 100% use in systems with a rapid initial loss (30% of charge) and subsequent total loss of charge over 10 years

1978 to 1984: 10% hermetic, 10% use in systems with rapid initial loss

1985 to 1993: 20% hermetic, zero use in systems with rapid initial loss

1994 onwards: 30% hermetic, zero use in systems with rapid initial loss

Data affected are identified by green or blue shading.

Material in "Long Banking Times" applications is released at the rate of 2%/year.

(McCulloch A., P.M. Midgley and P. Ashford, Releases of Refrigerant Gases (CFC-12, HCFC-22 and HFC-134a) to the Atmosphere, *Atmos. Environ.*, 37, 889-902, 2003)

Notes

In previous reports, from 1996 to 2002 fugitive emissions were incorrectly calculated. This has now been rectified with small changes to the data for the years [identified](#).

Emissions are calculated from production and categorised sales using "emission functions".

The emission functions for HCFC-124 remain the same as in previous AFEAS compilations:

Of the sales into "Short Banking Times" (mainly open cell foam), 83% are released in the year of manufacture and the remainder in the year following.

Releases from "Medium Banking Times" (predominantly refrigeration) are complete within 10 years, distributed approximately normally about a 4.5 year mean following a 30% initial loss.

Material in "Long Banking Times" applications is released at the rate of 2%/year.

Notes

In previous reports, from 1996 to 2002 fugitive emissions were incorrectly calculated. This has now been rectified with small changes to the data for the years identified.

Emissions are calculated from production and categorised sales using "emission functions".

The emission functions for HCFC-141b remain the same as in previous AFEAS compilations:

Of the sales into "Short Banking Times" (mainly open cell foam), 83% are released in the year of manufacture and the remainder in the year following.

Releases from "Medium Banking Times" (predominantly refrigeration) have an initial loss of 30%, with the remainder normally distributed about a mean of 4.5 years and a total service lifetime of 10 years.

Material in "Long Banking Times" applications (mainly closed cell foams) is released at the rate of 10% in the first year and 4.5%/yr thereafter.

Notes

In previous reports, from 1996 to 2002 fugitive emissions were incorrectly calculated. This has now been rectified with small changes to the data for the years identified.

Emissions are calculated from production and categorised sales using "emission functions".

The emission function for "Long" banking times was changed in 2001 in view of the results of a survey commissioned by AFEAS:

(Ashford P., 1999, Development of a global emission function for blowing agents used in closed cell foam, Final Report to AFEAS)

This showed that most (94%) of the HCFC-142b in closed cell foams was used to blow extruded polystyrene, the emission function for which comprises

32.5% loss in the year of manufacture and 3%/yr thereafter.

Columns affected by this change are shaded pale green/blue.

The emission function for "Short" banking time (e.g. open cell foam) is the same as in previous reports (83% emitted in the year of manufacture and 100% the year after).

The emission function for "Medium" banking time (mainly refrigeration) is the same as in previous reports (an initial loss of 30%, with the remainder

normally distributed about a mean of 4.5 years, with a total service lifetime of 10 years).

Notes

In previous reports, from 1997 to 2002 fugitive emissions were incorrectly calculated. This has now been rectified with small changes to the data for the years **identified**.

Emissions are calculated from production and categorised sales using "emission functions".

The emission function for "Long" banking times was changed in 2001 in view of the results of a survey commissioned by AFEAS and

(Ashford P., 1999, Development of a global emission function for blowing agents used in closed cell foam, Final Report to AFEAS and McCulloch A., P.M. Midgley and P. Ashford, Releases of Refrigerant Gases (CFC-12, HCFC-22 and HFC-134a) to the Atmosphere, *Atmos. Environ.*, 37, 889-902, 2003)

The survey showed that most (99%) of the HFC-134a in closed cell foams was used to blow expanded polystyrene, the emission function for which comprises

32.5% loss in the year of manufacture and 3%/yr thereafter.

Columns affected by this change are shaded pale green/blue.

The emission function for "Short" banking time (e.g. aerosols) is the same as in previous reports (50% emitted in the year of manufacture and 100% the year after).

The emission function for "Medium" banking time (predominantly refrigeration) is the same as in previous reports (normally distributed about a mean of 4.5 years, with a total service lifetime of 10 years).
